

LSV
Lech-Stahl Veredelung

Take advantage of our competence in inductive quenching and tempering!

LSV Lech-Stahl Veredelung is a reliable partner for customers who appreciate steel know-how.

We also apply our expert knowledge of inductive quenching and tempering to the tube. Inductive quenching and tempering of tubes makes it possible to use the product in applications that require high strength or notched bar impact strength. We use this process to optimise the mechanical-technological properties, e.g. for special requirements such as high internal pressure loads on the tube.

We offer the quenching and tempering of tubes in a range from 18mm to 60mm outer diameter with variable wall thickness.
